Main goal

Computing the smallest box containing the solution of the initial value problem $\dot{x} = f(x), x(0) \in [x]$

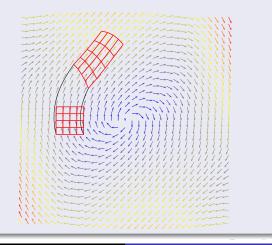

Main goal

Computing the smallest box containing the solution of the initial value problem $\dot{x} = f(x), x(0) \in [x]$

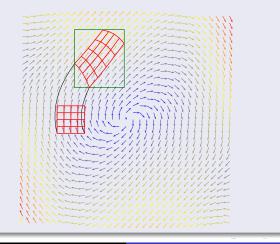

Main goal

Computing the smallest box containing the solution of the initial value problem $\dot{x} = f(x), x(0) \in [x]$

Main goal

Computing the smallest box containing the solution of the initial value problem $\dot{x} = f(x), x(0) \in [x]$

Outline

1 Interval analysis, optimal inclusion function

- Inclusion function
- Optimal inclusion function

2 Computing optimal validated solutions for ODE

- ODE, Dynamical system and flow
- Derivative of the flow with respect to initial condition
- Algorithm

・ 同 ト ・ ヨ ト ・ ヨ ト

Definition

Let f be a function from \mathbb{R}^n to \mathbb{R}^m . A function $[f] : \mathbb{IR}^n \to \mathbb{IR}^m$ satisfying : $\forall [x] \in \mathbb{IR}^n, f([x]) \subset [f]([x])$ is an inclusion function of f.

 FIG .: Illustration of inclusion function.

イロン イヨン イヨン イヨン

3

remark

• Interval arithmetic gives a method to compute an inclusion function of a given function defined by an arithmetical expression.

・ロト ・回ト ・ヨト ・ヨト

3

remark

- Interval arithmetic gives a method to compute an inclusion function of a given function defined by an arithmetical expression.
- In general, the smallest inclusion function is not obtained and one only has : f([x]) ⊊ [f]([x]).

ヘロン 人間 とくほど くほとう

Theorem

Let [x] be a box of \mathbb{R}^n and f be a differentiable function $\mathbb{R}^n \to \mathbb{R}$. Let us denote by $f_*(x)$ the jacobian matrix

$$\left(\begin{array}{cc} \frac{\partial f}{\partial x_1}(x) & \dots & \frac{\partial f}{\partial x_n}(x) \end{array}\right)$$

Suppose that all components of $f_*([x])$ are non-negative, then $[f(\underline{x}), f(\overline{x})]$ is the smallest interval containing f([x]).

イロン イヨン イヨン イヨン

Inclusion function Optimal inclusion function

Example

Let us consider the function $f: (x_1, x_2) \mapsto 3x_1^2 - 2x_1x_2 + 3x_2^2$.

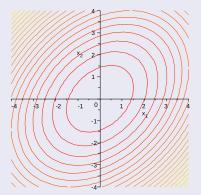

FIG.: Level curves.

Inclusion function Optimal inclusion function

Example

Let us consider the function $f: (x_1, x_2) \mapsto 3x_1^2 - 2x_1x_2 + 3x_2^2$.

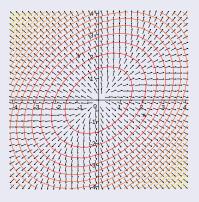

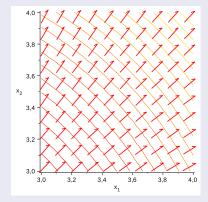

FIG.: Level curves.

Inclusion function Optimal inclusion function

Example $f: (x_1, x_2) \mapsto 3x_1^2 - 2x_1x_2 + 3x_2^2$

Since $f_*(x_1, x_2) = (6x_1 - 2x_2 - 2x_1 + 6x_2)$, one has

 $\{f_*(x_1, x_2) \mid (x_1, x_2) \in [3, 4] \times [3, 4]\} \subset \mathbb{R}^+ \times \mathbb{R}^+.$

Nicolas Delanoue - Luc Jaulin A new method for integrating ODE based on monotonicity

Inclusion function Optimal inclusion function

Example $f: (x_1, x_2) \mapsto 3x_1^2 - 2x_1x_2 + 3x_2^2$

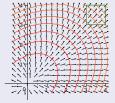

FIG.: Level curves.

• According to the previous theorem, one can conclude that $f([3,4] \times [3,4]) = [f(3,3), f(4,4)] = [36,52].$

Inclusion function Optimal inclusion function

Example $f: (x_1, x_2) \mapsto 3x_1^2 - 2x_1x_2 + 3x_2^2$

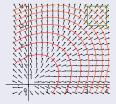

FIG.: Level curves.

- According to the previous theorem, one can conclude that $f([3,4] \times [3,4]) = [f(3,3), f(4,4)] = [36,52].$
- This result can be compare to the one obtained applying interval arithmetic : 3 * [3,4]² - 2 * [3,4] * [3,4] + 3 * [3,4]², *i.e.* [22,78].

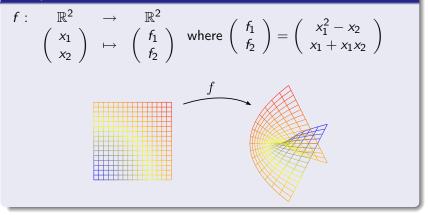

Corollary

Let [x] be a box of \mathbb{R}^n and f be a differentiable function $\mathbb{R}^n \to \mathbb{R}^m$. Let us denote by $f_*(x)$ the jacobian matrix

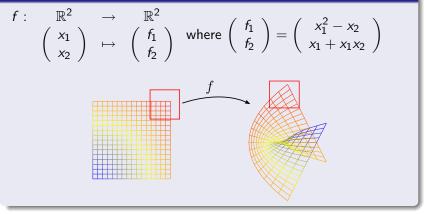

$$\left(\frac{\partial f_j}{\partial x_j}(x)\right)_{1\leq i\leq n, 1\leq j\leq n}$$

Suppose that no component of $f_*([x])$ contains 0, then there exists 2m corners $\underline{\tilde{x}}_j$ and $\overline{\tilde{x}}_j$ of [x] such that $\prod_{1 \le j \le n} [f_j(\underline{\tilde{x}}_j), f_j(\overline{\tilde{x}}_j)]$ is the smallest box containing f([x]).
